

```
### Natural Join ==>
=====
```

\* A natural join joins tables based on the columns with the same name and data type.

\* Here there is no need to prefix the column name with the table alias, and the join is indicated with the keywords NATURAL JOIN.

\* There is not even a mention of which column(s) to join.

\* Any use of the ON clause is also not allowed with the NATURAL JOIN keywords, and the common columns cannot list a table alias.

\* Syntax:

- SELECT columns FROM table1 NATURAL JOIN table2 ;

# WAQ to display ename ,dname and deptno of all the employees in the company.

- select ename, dname, deptno from emp natural join dept;

ENAME	DNAME	DEPTNO
